

Codeskate CRM — App Review: Reviewer Instructions

App ID 1581914519978056 · <https://crm.codeskate.com> · Multi-tenant lead management SaaS
(verified Tech Provider)

1. What the app does

Codeskate CRM is a multi-tenant lead management platform. Each business (workspace) connects **its own** Facebook Page and WhatsApp Business account. Leads submitted through the business's Facebook Lead Ads instant forms flow automatically into its CRM workspace and are assigned to a team member, and the business can reply to its own customers over WhatsApp from inside the CRM. Data for each business is isolated to its own workspace; access tokens are stored encrypted and never appear in lead records or logs.

2. Test login (no real phone required)

Site URL: <https://crm.codeskate.com>

Phone number: 9999999999

OTP code: 123456

This is a dedicated review account. No SMS is sent — the code above always works. It logs into a workspace where a Facebook Page and a WhatsApp Business account are already connected, so all features can be reviewed without any payment or subscription.

1. Open <https://crm.codeskate.com> and choose phone login.
2. Enter the phone number 9999999999 .
3. When prompted for the OTP, enter 123456 .
4. You will land in a workspace with a Facebook Page and WhatsApp Business account already connected.

3. Reviewing Facebook Lead Ads

Demonstrates leads_retrieval, pages_show_list, pages_read_engagement, pages_manage_metadata, business_management.

1. From the sidebar, open **Ads Lead Integration**. The connected Facebook Page shows a **“Connected”** status. (Connecting a Page uses Facebook Login for Business —

`pages_show_list` to list the admin's Pages, `pages_read_engagement` to confirm access, `business_management` for Business-owned Pages, and `pages_manage_metadata` to subscribe to the Page's leadgen webhook.)

2. Open Meta's **Lead Ads Testing Tool**, select the connected Page and a form, delete any existing test lead, then click **Create Lead**.
3. Return to the CRM **Leads** page. The test lead appears automatically, tagged as a **"Meta Lead Ads"** source, and is auto-assigned to a team member. This demonstrates `leads_retrieval` : on the leadgen webhook, the app fetches the lead's name, phone, and email and creates the CRM record.

4. Reviewing WhatsApp

Demonstrates `whatsapp_business_messaging` and `whatsapp_business_management`.

1. Open the **WhatsApp** section to view the connected phone number and the account's message templates. This demonstrates `whatsapp_business_management` (reading connected phone numbers and reading/managing templates).
2. Open a customer conversation and send a reply within the 24-hour customer service window. This demonstrates `whatsapp_business_messaging` . Messages are only sent to customers who have already contacted the business.

5. Permission-to-feature map

Permission	Where it is used in the app
<code>pages_show_list</code>	Lists the admin's Facebook Pages (<code>/me/accounts</code>) so they can select the Page to connect.
<code>pages_read_engagement</code>	Confirms access to the selected Page and reads its basic metadata (id, name) to associate leads correctly.
<code>pages_manage_metadata</code>	Subscribes the app to the Page's <code>leadgen</code> webhook via <code>POST /{page-id}/subscribed_apps</code> .
<code>leads_retrieval</code>	On a leadgen webhook, fetches the lead's field data (name, phone, email) and creates a CRM record.
<code>business_management</code>	Lets admins whose Pages are owned by a Business portfolio list and connect those Pages.
<code>whatsapp_business_messaging</code>	Sends session replies and approved templates via <code>/phone-number-id/messages</code> ; receives inbound messages via webhooks.
<code>whatsapp_business_management</code>	Reads connected phone numbers and reads/manages message templates for the connected WhatsApp Business Account.

public_profile	Identifies the logged-in admin during Facebook Login.
----------------	---

6. Data handling summary

- Platform Data is stored in Google Cloud Firestore (asia-south1) with per-workspace tenant separation and role-based access control.
- Integration access tokens are encrypted (AES-256-GCM) and never appear in lead records or logs.
- All incoming webhooks are verified with signature validation before processing.
- Data is used only to deliver a business's own leads and messages into its own workspace. It is never sold and never used for advertising or audience building.
- Deletion can be requested at <https://crm.codeskate.com/data-deletion> and is processed within 30 days.
